# User-defined functions

INTRODUCTION TO FUNCTIONS IN PYTHON

Hugo Bowne-Anderson
Instructor

What you will learn:

- Define functions without parameters

- Define functions with one parameter

- Define functions that return a value

- Later: multiple arguments, multiple return values

Built-in functions

- `str()`

```
x = str(5)

print(x)
```

```
'5'
```

```
print(type(x))
```

```
<class 'str'>
```

Defining a function

```python
def square():      # <- Function header
    new_value = 4 ** 2    # <- Function body
    print(new_value)
square()
```

```
16
```

Function parameters

```python
def square(value):
    new_value = value ** 2
    print(new_value)

square(4)
```

```
16
```

```python
square(5)
```

```
25
```

Return values from functions

- Return a value from a function using return

```python
def square(value):
    new_value = value ** 2
    return new_value
num = square(4)

print(num)
```

```
16
```

Docstrings

- Docstrings describe what your function does

- Serve as documentation for your function

- Placed in the immediate line after the function header

- In between triple double quotes """

```python
def square(value):
    """Returns the square of a value."""
    new_value = value ** 2
    return new_value
```

Let's practice!

INTRODUCTION TO FUNCTIONS IN PYTHON

Multiple Parameters and Return Values

INTRODUCTION TO FUNCTIONS IN PYTHON

Hugo Bowne-Anderson
Instructor

Multiple function parameters

- Accept more than 1 parameter:

```python
def raise_to_power(value1, value2):
    """Raise value1 to the power of value2."""
    new_value = value1 ** value2
    return new_value
```

- Call function: # of arguments = # of parameters

```python
result = raise_to_power(2, 3)

print(result)
```

```
8
```

A quick jump into tuples

- Make functions return multiple values: Tuples!

- Tuples:
  - Like a list - can contain multiple values

  - Immutable - can't modify values!

  - Constructed using parentheses ()

```python
even_nums = (2, 4, 6)

print(type(even_nums))
```

```
<class 'tuple'>
```

Unpacking tuples

- Unpack a tuple into several variables:

```
even_nums = (2, 4, 6)

a, b, c = even_nums
```

```
print(a)
```

```
2
```

```
print(b)
```

```
4
```

```
print(c)
```

```
6
```

Accessing tuple elements

- Access tuple elements like you do with lists:

```python
even_nums = (2, 4, 6)

print(even_nums[1])
```

```
4
```

```python
second_num = even_nums[1]

print(second_num)
```

```
4
```

- Uses zero-indexing

Returning multiple values

```python
def raise_both(value1, value2):
    """Raise value1 to the power of value2
    and vice versa."""

    new_value1 = value1 ** value2
    new_value2 = value2 ** value1

    new_tuple = (new_value1, new_value2)

    return new_tuple
```

```python
result = raise_both(2, 3)

print(result)
```
```
(8, 9)
```

Let's practice!

INTRODUCTION TO FUNCTIONS IN PYTHON

Bringing it all together

INTRODUCTION TO FUNCTIONS IN PYTHON

Hugo Bowne-Anderson
Instructor

What you have learned:

- How to write functions
  - Accept multiple parameters

  - Return multiple values

- Up next: Functions for analyzing Twitter data

Basic ingredients of a function

- Function Header

```python
def raise_both(value1, value2):
```

- Function body

```python
    """Raise value1 to the power of value2
    and vice versa."""

    new_value1 = value1 ** value2
    new_value2 = value2 ** value1

    new_tuple = (new_value1, new_value2)

    return new_tuple
```

Let's practice!
